Change Maps API Geocode values

⌚ 1 min read Last Updated: ⌚ 4 months ago

On this page

If you run into the situation on the add listing page where the maps API is returning a wrong or unwanted value you can alter it.

In the below code snippet example the region is returning "East Lothian Council" however the area is better known as just "East Lothian" so we set the `getState` variable to alter it.

You can use the [Code Snippets plugin](#) to add this to your site:

```
function _my_add_listing_geocode_fix() {  
    ?>  
    if(getState == "East Lothian Council"){ getState = "East Lothian";}  
    <?php  
}  
add_action( 'geodir_add_listing_geocode_js_vars', '_my_add_listing_geocode_fix'
```

[PHP](#)[Copy](#)

Other variables that can be adjusted are:

```
getAddress, getZip, getCity, getState, getCountry, getAddress2, baseCountry
```
