Installing GeoDirectory

⌚ 1 min read Last Updated: ⌚ 4 months ago

There are two ways to install GeoDirectory.

It is recommended that you choose your theme before activating GeoDirectory.

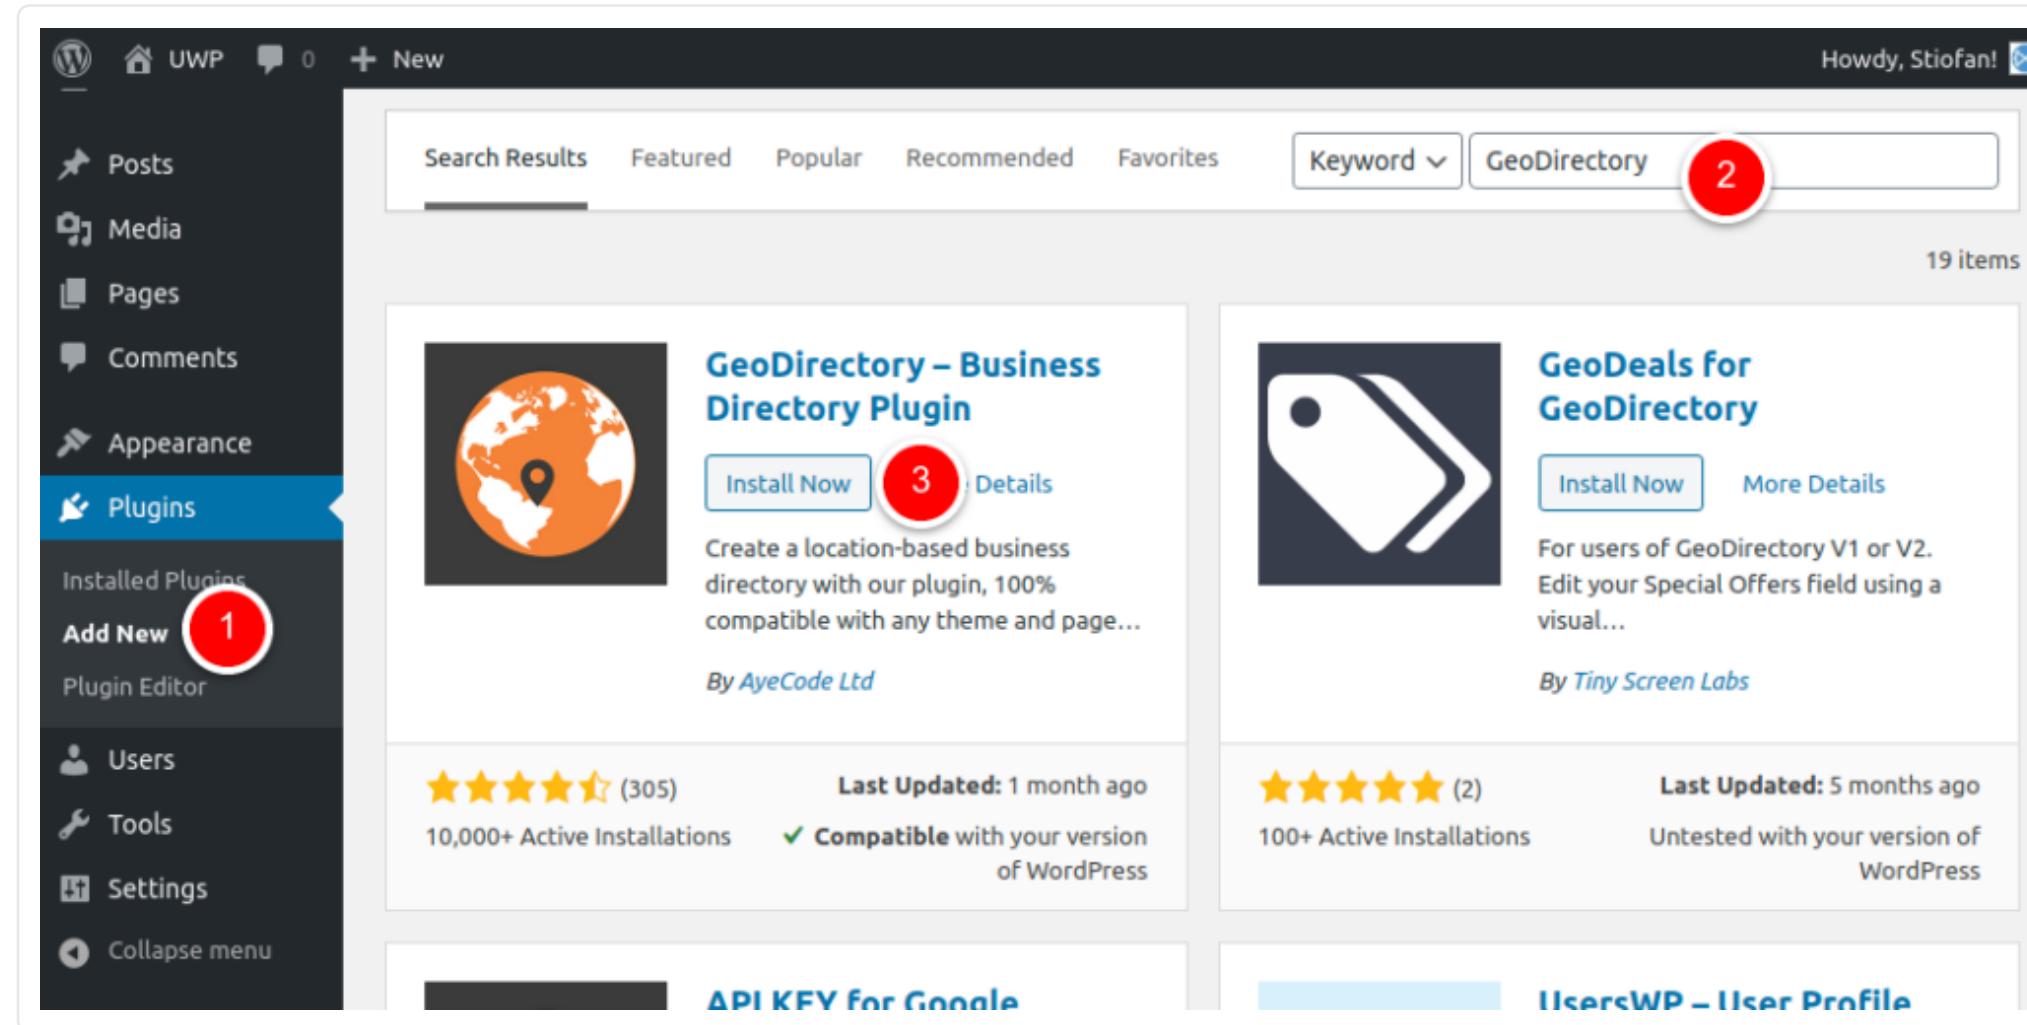

- ⓘ You can change your theme later, but you may have to re-do your menus and widgets, or run the [GeoDirectory Setup Wizard](#) again.

Via the WordPress dashboard

- ① From the Dashboard select **Plugins > Add New**.

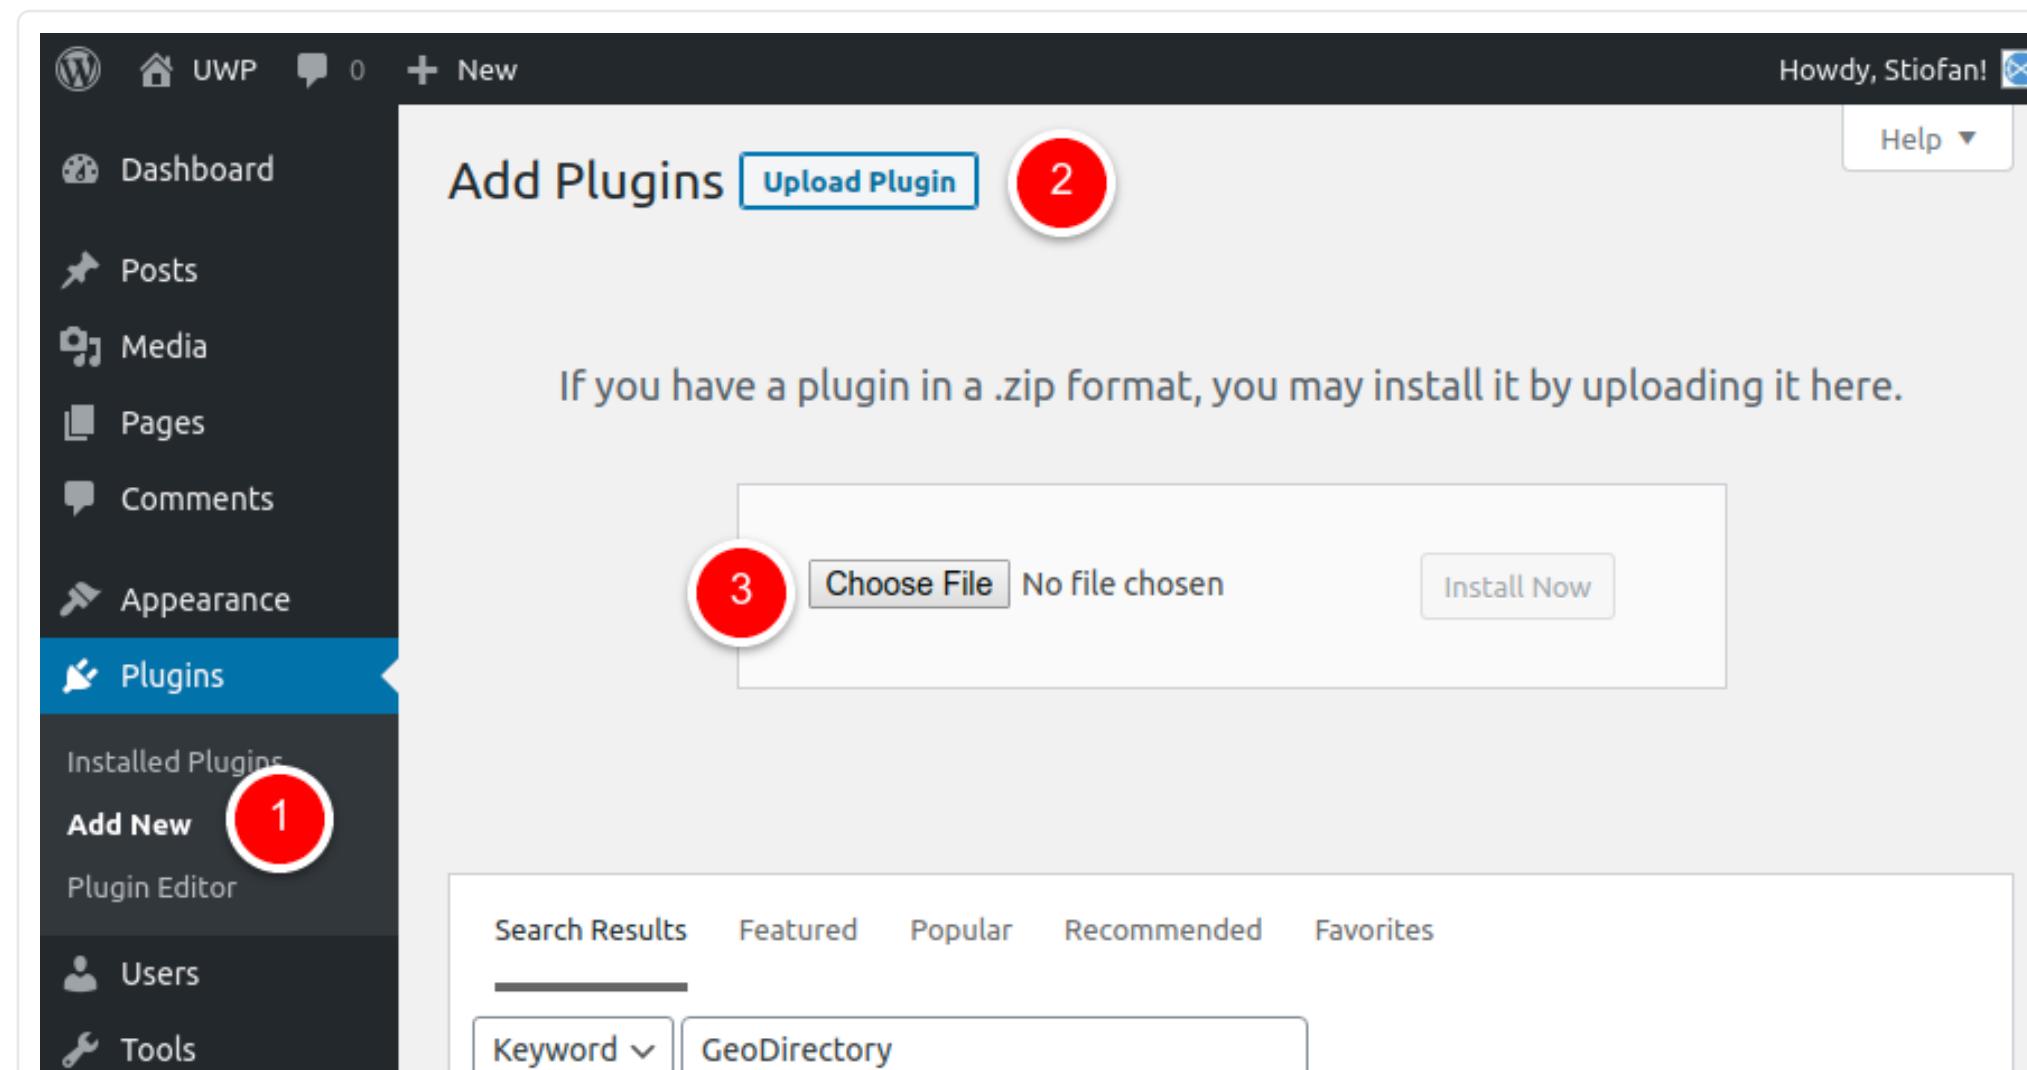

- ② In the search field enter “GeoDirectory”, then select **install** on “GeoDirectory – Business Directory Plugin”

- ③ After installation, click **Activate**.

Via wpGeoDirectory.com

- ① Go to wpgeodirectory.com and click “Get GeoDirectory”
- ② From the WordPress Dashboard select **Plugins > Add New**.
- ③ Click **Upload Plugin**, and select the file you downloaded from GeoDirectory.

ⓘ We strongly recommend that you also [install AyeCode Connect](#) — our helper plugin that helps you seek support for GeoDirectory and facilitates troubleshooting.

Once you have installed GeoDirectory, you may head to **GeoDirectory > Extensions** and start installing any GD extensions that you may need to.
